  The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of Agrobacterium sp. strain CP4 It is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. corn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22301 and AAR22302.

AAW34683-89 represent a new class of glyphosate-tolerant
5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
6-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These encymes are part of the shikimic belong to a new class, Class II. The present sequence is from a compounds.
6-enolpyruvylshikimic cat the blosynthesis of aromatic compounds.
6-enolpyruvyl-3-phosphoshikimic acid (EPE) and 3-phosphoshikimic acid pathway, which leads to the blosynthesis of aromatic compounds.
6-enolpyruvyl-3-phosphoshikimic acid, and is inhibited by the conforming glyphosate. It would be useful to produce transgenic crops herbicide glyphosate resistance genes so that glyphosate-containing containing glyphosate resistance genes so that glyphosate-containing containing glyphosate is set in the plant is made glyphosate-containing containing class and a high ki for glyphosate-containing made glyphosate structury is not affected. These class II EPSPS enzymes are EPSPS enzyme activity is not affected. These class II EPSPS enzymes are promoted into a plant, the plant is made glyphosate-tolerant, and choroplast, which is the site for the shikimic acid pathway. In addition, the EPSPS gene is cloned into a plant under the control of a promoter such as figwort mosaic virus promoter or the cauliflower mosaic virus promoter, so that expression is enhanced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 KAMQAMGARIRKEGDTWIIDGVGNGGLLAPEAPLDFGNAATGCRLTMGLVGVYDFDSTFI 120

Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants

                                                                                                                                                                                                                                                                                                  The present invention relates to a DNA probe capable of use in a polymerase chain reaction for identifying the presence of a target genomic DNA encoding 5-enclpyruvylshikinate-3-phosphate synthase (EPSPS) enzyme referred to as class II EPSPS enzyme which is tolerant to glyphosate. EPSPS genes are useful in producing transformed bacteria probe is useful for identifying the presence of a target genomic DNA encoding a EPSPS enzyme. The presence of a target genomic DNA encoding a EPSPS enzyme. The present sequence is Agrobacterium sp. strain CP4 class II EPSPS protein.

Note: The present sequence, SED ID NO: 3 is stated as amino acid sequence throughout the specification. However, it is referred as probe in claim 3 of the specification.
                                                                                                                                                                                                                      DNA probe capable of use in a polymerase chain reaction for identifying the presence of a target genomic DNA encoding a 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

This sequence represents the synthetic CP4 5-enolpyruvyl-3-shikimate phosphate synthase (PSPS) gene which is capable of confering resistance to glyphosate and is used in a novel method for producing fruit-bearing plants with delayed ripening. The method involves the expression of a 1-aminocyclopropane-1-carboxylic acid (ACC) deaminase gene in a plant at a level sufficient to reduce ethylene production in the fruit.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAR26448 and AAR26449 are encoded by genes which were used in the construction of an expression plasmid pMoNI1030 which was used to transform petunia plants. This plasmid contained the genes for chloroplast transit peptide (CTP2) (AAR264448) and the CP4 synthetic 5-enolpyruvyl-3-shikimate phosphate synthetase (EPSES) gene (AAR26449) which is capable of conferring resistance to glyphosate. The plasmid deaminase gene from Pseudomonas chloropane-1-carboxylic acid (ACC) deaminase gene from Pseudomonas chloropanis (see also AAQ27199). The transformed plants had ethylene levels reduced to about one half that of the control, untransformed plants. It is expected that such plants will show reduced senesence of flowers and leaves when compared to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 KAMQAMGARIRKEGDTWIIDGVGNGGLLAPEAPLDFGNAATGCRLTMGLVGVYDFDSTFI 120

(2) glyphosate oxidoreductase (GOX) activity different from the natural GOX activity of the plant; and in which a gene encoding a protein having the following properties: (a) combines specifically with a substance participating to the herbicidic activity a herbicide of protoporphyrinogen IX oxidase inhibiting type; (b) has substantially no denaturing activity on a substance to which said protein combines specifically; and (c) contains substantially no framework region of the variable region of immunoglobulin. The present sequence is that of the Petunia hybrida EPSPS chloroplast transit peptide and the Agrobacterium sp. strain CP4 EPSPS gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Glyphosate tolerant bacteria; herbicides; glyphosate resistant plants; 5'-enolpyruvylshikimate-3-phosphate synthase; weed control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        432

                                                                                                                  The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of Achromobacter sp. strain LBAA It is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. corn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22300 and AAR22302.

The crops selected for are e.g. corn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22300 and AAR22301.

```
Away4683-89 represent a new class of glyphosate-tolerant
C 5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
C 5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
C 5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
C EPSPS enzymes have little homology with known class I EPSPS enzymes, and
C EPSPS enzymes are part of the
C Achromobacter sp. strain LBAA. The EPSPS enzymes are part of the
C Achromobacter sp. strain LBAA. The EPSPS enzymes are part of the
C Shikimic acid pathway, which leads to the biosynthasis of aromatic
C C compounds. EPSPS corverts phosphoenolpyruvic acid (PEP) and
C 3-phosphoshikimic acid to 5-enolpyruvyl-3-phosphoshikimic acid, and is
C 1-phosphoshikimic acid glyphosate. It would be useful to produce
C Inhibited by the herbicides glyphosate. It would be useful to produce
C 1 phyphosate-containing herbicides can be applied to selectively kill
C weeds. The novel EPSPS enzymes exhibit a low Km for PEP and a high Ki for
C glyphosate-tolerant, and EPSPS enzyme activity is not affected. These
C glyphosate-tolerant, and EPSPS enzyme activity is not affected. These
C class II EPSPS enzymes are fused to a chloroplast transit peptide to
C target the protein into the chloroplast, which is the site for the
C Shikimic acid pathway. In addition, the EPSPS gene is cloned into a plant
C the cauliflower mosaic virus promoter so that expression is enhanced.
                                                                                                                                                                                                                                                                     5-enolpyruvylshikimate-3-phosphate synthase; EPSPS; glyphosate;

                                                                                                                                                                                                                                                                                                                                                                                                                                    glyphosate-tolerant, and EpsPS enzyme activity is not affected. These class II EPSPS enzymes are fused to a chloroplast transit peptide to target the protein into the chloroplast, which is the site for the shikimic acid pathway. In addition, the EPSPS gene is cloned into a plant under the control of a promoter such as figwort mosaic virus promoter or the cauliflower mosaic virus promoter, so that expression is enhanced.
                                                                                                                                                                                                                                                                                                                                                                                                                  for
                                                                                                                                                                                                                                                              AAW34683-89 represent a new class of glyphosate-tolerant EPSPS enzymes have little homology with known Class I EPSPS enzymes, and belong to a new class, Class II. The present sequence was isolated from Pseudomonas sp. strain PG2982. The EPSPS enzymes are part of the Pseudomonas sp. strain PG2982. The EPSPS enzymes are part of the Pseudomonas sp. strain PG2982. The EPSPS enzymes are part of the Compounds. EPSPS converts phosphoenolpyruvic acid (PEP) and 19-phosphoshikimic acid to 5-enolpyruvyl-3-phosphoshikimic acid, and is inhibited by the herbicide glyphosate. It would be useful to produce transgenic crops containing dlyphosate. It would be useful to produce transgenic crops containing dlyphosate resistance genes so that glyphosate containing herbicides can be applied to selectively kill weeds. The novel EPSPS enzymes exhibit a low Km for PEP and a high Ki for all produced into a plant, the plant is made

Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, whact, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121 GDASLTKRPMGRVLNPLREMGVQVKSEDGDRLPVTLRGPKTPTPTTTYRVPMASAQVKSAV 180

AAW24480 shows the sequence of a class II 5-enolpyruvylshikimate-3-phosphate synthase (ERSPS) enzyme. Class II ERSPS enzymes are tolerant to glyphosate herbicides. ERSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oliseed rape, canola, flax, sunflower, potato, tobacco, tomato, a lfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.
